

I am in favor of this proposal with the exception of the allocation at 135.7 to 137.8 kHz. I feel this is too narrow of a frequency range and would suggest something on the order of 130 to 160 kHz. I also believe that more power should be allowed to facilitate experimentation. I would suggest a maximum transmitter power of 50 Watts RF output instead of using EIRP, as it may be difficult for average users to calculate EIRP values using homemade antennas.
